

SnapT — Development Handoff Document

For: Claude Code Prepared: July 26, 2026 **Prepared by:** Don, with Claude (design/product sessions)

0. How to use this document — read this first

This document compiles product decisions, business logic, and build sequencing from the full SnapT design process, including the Claude Design (CD) prototyping sessions. It's meant to be your primary reference for *what* to build and *in what order*. It should be read alongside:

- `SnapT_Project_Summary_v2.md` — the base product/design summary
- The 11 policy documents (`(01)`–`(11)`, listed in Section 18)
- The CD Verification Checklist
- The CD prototype itself (screens, as built)

Important status disclosure, read before building anything: A full click-through verification pass of the CD prototype was recommended before this handoff but has not been completed. The CD screens described in this document reflect what was *prompted*, not confirmed *as-built*. Treat descriptions of UI/flow in this document as directional intent, not pixel-confirmed spec. Where the CD prototype and this document conflict, flag it back to Don rather than silently picking one — several rounds of prompts this session touched overlapping screens (sign up, login, booking detail, session day) and it's possible not everything landed as intended.

Second disclosure: Section 6 lists specific numeric/policy values that are working defaults, not confirmed-final. Do not hard-code these as immutable — build them as configurable values (ideally admin-editable later) and confirm the actual numbers with Don before they affect financial logic (refunds, payouts, fees).

1. Product overview

SnapT is an on-demand marketplace connecting clients with vetted photographers/videographers, either booked for in-person sessions or hired remotely to edit footage the client already has. Launching in Saint Lucia, expanding across the Caribbean after. Single app, client/creator mode toggle in Profile.

Brand: Primary yellow/gold (`#FFB800`), off-white (`#FAFAFA`), near-black (`#1A1A1A`), muted grey (`#767676`), success green (`#2ECC71`), error red (`#EB5757`). Inter typeface. Rounded 16px cards, floating black-pill nav bar, warm/confident/non-corporate tone.

Full feature and flow detail: see `SnapT_Project_Summary_v2.md` for the base app structure, onboarding, booking flow re-sequencing rationale, and app-wide patterns (FAB, slide-to-confirm usage rules). This document does not repeat that content — it adds everything decided in the following working sessions.

2. Tech stack (confirmed)

- **Frontend:** React Native + Expo
 - **Backend:** Node.js / TypeScript
 - **Database:** PostgreSQL via Supabase (also Auth)
 - **File storage:** Cloudflare R2
 - **Payments:** Stripe + Stripe Connect (payout splitting)
 - **Push notifications:** Firebase Cloud Messaging
 - **Email:** Resend (transactional email — notification dispatcher, emergency contact sharing, account/security alerts). No SMS provider is used anywhere in the product.
 - **Maps:** Google Maps API (prototype uses unconfigured dev key — production key/billing/domain setup required)
 - **Admin Portal:** Separate responsive web app — not yet started
-

3. Recommended build order (phased)

Build in this sequence. Each phase depends on the one before it. Do not build Phase 2+ features against a placeholder/mock backend if it can be avoided — the client and creator apps currently simulate several things client-side (creator approval gating, availability, matching) that must become real before those features are trustworthy.

Phase 0 — Foundation Auth (email/phone + Google/Apple/Facebook OAuth), core data model (Section 4), Stripe + Stripe Connect setup, Supabase schema, base API structure. Nothing user-facing depends on this being "done," but nothing else should start until it exists.

Phase 1 — Core booking & shared data model Server-side creator approval/authorization (currently client-side simulated — this must move server-side first). Slot-availability engine (real bookable date/time computation — currently simulated via demo toggle in the prototype). Area-snapping/geocoding logic. Booking creation, the full re-sequenced flow end-to-end, real (not simulated) availability on the Date & Time screen.

Phase 2 — Cancellation, reschedule, no-show, and payment logic Fee-tier calculation engine (Section 6), Stripe charge/refund logic tied to those tiers, reschedule logic, no-show grace-period and reporting logic (client and creator sides), creator strike system (Section 9).

Phase 3 — Client and creator app feature completion Remaining client app screens (Wallet, full Profile, Help & Support), remaining creator app screens (Earnings with real payout logic, Schedule, Ratings & Growth with real trend calculation), chat (Supabase Realtime is the likely fit), footage/edit upload and delivery pipeline with correct raw-footage access restrictions (creator/editor only, never client).

Phase 4 — Trust, safety, disputes, and notifications infrastructure SOS/safety reporting backend + admin escalation routing, emergency contact sharing via email (Resend), dispute intake and evidence-window logic (Section 10), notification trigger dispatcher service (Section 13) wired to every event defined in the Notification Trigger Mapping

document, live GPS tracking for "creator en route" (if in scope — confirm with Don; not firmly committed yet).

Phase 5 — Admin Portal Build once Phases 0–4 establish the shared data model this portal reads/writes against. See Section 15 for full scope. Do not build this as an independent app with its own data assumptions — it must sit on the same backend as the client/creator apps.

Phase 6 — Legal & policy content management system Draft/publish workflow, versioning, forced re-consent logic (Section 14). This can technically happen in parallel with Phase 5 since it's mostly Admin Portal + a content-serving layer, but depends on Admin Portal auth/permissions existing first.

Phase 7 — Production infrastructure cutover Real Supabase, Cloudflare R2, Stripe (+Connect), Google Maps production key/billing, Firebase, OAuth credentials, Resend account. Real legal content (post-attorney-review versions of the 11 policy docs replace the drafts). Real FAQ copy.

Open sequencing question for Don, not yet resolved: the project has floated a "remote editing MVP first, then in-person booking layer" phased launch strategy. If that's still the intent, Phase 1–2 above should be split so remote-editing order flow ships first and in-person booking (availability engine, meeting point, check-in) follows in a second release. Confirm before finalizing sprint planning — this materially changes what "MVP" means for the first ship date.

4. Core data model / entities

Not exhaustive schema, but the entities every subsequent section assumes exist:

- **User** — base identity, auth, mode (client/creator), currency preference, notification preferences, emergency contact(s)
- **CreatorProfile** — extends User; vetting status, background check status/date, specialties (multi-select: Events/Portraits/Social/Family/Wedding), service radius, availability schedule, blocked dates, verified badge status
- **Booking** — client, creator (nullable until matched), type (in-person/remote), occasion, duration/package, area, exact meeting point, scheduled datetime, status (pending/confirmed/completed/cancelled/no-show/disputed), pricing snapshot at time of booking
- **Session** — tied to a Booking; check-in state, safety code verification, session-active timestamp, session-ended timestamp
- **Transaction** — payment charged, refunds, fees applied, tied to a Booking, currency + peg rate at time of transaction
- **CreatorPayout** — earnings state (pending/available/paid out), holding-window timestamps, fee rate applied (standard or promo)
- **Strike** — creator, type (cancellation/late-cancellation/no-show), timestamp, rolling-window expiry, whether contested/overtaken

- **Dispute** — booking reference, opened-by, category (quality/fulfillment/conduct/appeal), evidence submissions, status, resolution, resolution timestamp
 - **SafetyReport** — session reference, reporter, type (SOS/report/end-session), timestamp, admin queue status, escalation status
 - **Notification** — user, trigger type, channel(s) sent (push/in-app/email), read status, category (for inbox filtering)
 - **PolicyDocument** — type (one of the 12 listed in Section 18), version, content, status (draft/published), published timestamp, requires-re-consent flag
 - **ConsentRecord** — user, policy document + version, timestamp (needed for Creator Agreement and Background Check Disclosure specifically — see Section 14)
 - **Review** — booking reference, client, creator, rating (1-5), per-category breakdown (flexible/jsonb until Phase 3 rating UX pins exact categories), comment, timestamp. One review per client per booking. Added post-handoff: this entity was missing from the original document despite several already-specified screens (Creator Profile Preview's rating bars, remote-edit per-category rating) assuming it exists. Schema exists as of commit `(0b6e89f)`; aggregation, trend calculation, and endpoints are still Phase 3 work.
-

5. Confirmed business logic & values

These are locked and can be built against directly.

Item	Value
Client service fee	8%, shown as line item at checkout
Creator platform fee	32% (standard rate; promo rates may apply, shown with strikethrough)
Currency	USD base/storage; XCD optional display at fixed peg 2.70 XCD = 1 USD
Advance booking window	14 days
Free revisions	1 per order; additional rounds paid add-ons
Cancellation — >48hrs before session	Full refund
Cancellation — 24-48hrs before session	50% charge
Cancellation — <24hrs before session	100% charge, no refund
Reschedule — >48hrs	Free, 1x; additional reschedules treated as cancel+rebook
Reschedule — <24hrs	Disabled entirely (widened from original <6hrs cutoff — resolves the 6-24hr gap not covered in the original policy; only cancel or contact support is available inside 24hrs)
Client service fee (8%) refundability	Non-refundable at every cancellation tier — only the session cost portion is refunded per the tier percentages above
Remote-edit order cancellation	Free, full refund if cancelled before an editor is assigned and begins work; not cancellable once editing has begun (revision process applies instead)
No-show grace period	15 minutes past scheduled start, both directions
Creator no-show outcome	Full refund to client; rematch or free cancel offered
Client no-show outcome	Full charge to client, no refund; creator receives standard payout
Creator strike window	Rolling 60 days
Strike tiers	1st = warning, 2nd = matching deprioritization (2 weeks), 3rd = suspension (1 week), 4th+ = manual admin review
Late cancellation strike weight	Counts as 2 strikes

Item	Value
No-show strike weight	Higher severity than cancellation; may trigger immediate suspension on first occurrence
Dispute filing window	7 days from session/delivery
Dispute evidence submission window	72 hours from notification
Dispute resolution target	~5 business days from evidence deadline
Dispute appeal window	14 days from decision
No-show/SOS action UX rule	No slide-to-confirm on "End session" (must stay frictionless); slide-to-confirm required on no-show reporting (financial consequence attached)

6. Open values — confirm with Don before these affect financial or legal logic

Build these as configurable, not hard-coded. Do not ship charge/refund logic against unconfirmed numbers.

- **Raw footage retention window** — drafted as 90 days after order completion. Also determines the re-edit ordering window.
- **Delivered content in-app availability** — drafted as 12 months.
- **Creator non-circumvention period** — drafted as 12 months (Creator Agreement, Section 7).
- **Dispute window vs. payout holding window conflict** — the 7-day dispute window and 48-72hr payout holding window don't align; a dispute filed on day 5 requires clawing back an already-paid-out creator. Resolve by either extending the holding window, shortening the dispute window, or explicitly building clawback logic. **This needs a decision before Phase 2/4 payout logic is built**, not after.
- **Background check re-verification cadence** — drafted as every 24 months.
- **Tax handling** — whether displayed prices include or exclude applicable tax; needs accountant input, not just legal.
- **Background check provider** — not yet selected. Blocks finalizing the actual vetting integration and the Background Check & Vetting Disclosure document's specifics (Section 1 of that doc has bracketed placeholders that depend on the provider chosen).
- **Occasion → Duration smart-default mapping** — only two of five values were used as illustrative examples (Portraits, Wedding) in the CD prompt. All five (Events, Portraits, Social, Family, Wedding) need real default durations defined before the "smart default" feature ships correctly.

- **Occasion field scope decision** — confirmed as a real matching input (creators can be excluded from matching for occasions they don't specialize in), not merely a display label. This is settled; noted here only because it changes the CreatorProfile schema (Section 4) and the Creator Assignment query logic — make sure this isn't accidentally built as ranking-only.
-

7. Booking flow specification

Base re-sequenced flow (branching, availability-aware, meeting-point split) is fully documented in [\(Snapt_Project_Summary_v2.md\)](#) — build against that as the primary flow spec. This section adds what changed/was added since:

- **FAB "Book again" shortcut** — for clients with ≥ 1 completed booking, the FAB sheet shows a "Book again" card pre-filled from their most recent booking (creator, occasion, duration, area). Tapping it skips directly to Date & Time (still availability-checked, since the same creator may not be free). If unavailable, falls back to normal Creator Assignment with a note that the original creator wasn't available for this slot.
 - **Occasion-based smart default** — Duration & Package screen pre-selects a recommended duration based on the Occasion chosen earlier (values pending — see Section 6), fully overridable, labeled "Recommended for [Occasion]."
 - **Creator specialty matching** — Creator Assignment must **exclude**, not merely deprioritize, creators who haven't selected the relevant Occasion as a specialty. This is a hard filter in the matching query, not a ranking weight.
-

8. Cancellation, reschedule, and no-show logic

Full policy detail: [\(01_Cancellation_and_Refund_Policy.md\)](#). Build requirements:

- Cancel/Reschedule entry points on Booking Detail / Order Tracker
 - Fee-tier calculation must run server-side at time of action (not client-computed) to prevent tampering, using the values in Section 5
 - Reschedule flow reuses the existing Date & Time picker component
 - Creator-initiated cancellation triggers automatic full refund and client-facing banner with rematch/new-booking options — no client action penalizes them
 - No-show flow (both client and creator sides): 15-minute grace period with visible countdown; reporting action disabled until grace period elapses; creator-side reporting requires an attempted-contact confirmation step before the report can be filed; slide-to-confirm required on both sides' final confirmation (financial consequence)
 - No-show and cancellation outcomes both write to the creator Strike system (Section 9) where applicable
-

9. Creator reliability / strike system

Full detail: Section 5 of [\(02_Creator_Agreement.md\)](#) and the strike table in Section 5 above. This is backend + Admin Portal logic — no dedicated client or creator-facing screen beyond

the Earnings/standing area possibly reflecting current status (design not yet specified — flag to Don if a creator-facing status view is wanted, currently assumed strikes are visible only via admin and via the notification sent at each tier).

Build requirements:

- Rolling 60-day window computation, decaying automatically (not accumulating indefinitely)
 - Double-weighting for late (<24hr) cancellations
 - Separate, higher-severity handling for no-shows (can skip directly to suspension)
 - Admin Portal needs full visibility into per-creator strike history plus manual override/reset capability (Section 15)
 - Contested strikes route through the Dispute Resolution process (Section 10)
-

10. Dispute resolution system

Full policy: (`08_Dispute_Resolution_Policy.md`). Covers quality disputes (post-revision), fulfillment disputes (contested no-shows, cut-short sessions), conduct disputes, and enforcement appeals.

Build requirements:

- Dispute intake tied to a specific Booking, not free-text-only ("Report a Problem" needs a structured path)
 - 72-hour evidence window with automatic reminders to both parties
 - Evidence sources: chat logs, check-in/safety-code verification records, timestamps, session GPS records (if built), delivered content vs. package spec
 - Held funds during open disputes — no refund or payout finalizes until resolved (interacts with the Section 6 holding-window conflict — resolve that first)
 - Admin-side review and decision tooling (Section 15)
 - Appeal path (14 days, ideally routed to a different reviewer than the original decision)
-

11. Trust & safety features

Full policy: (`03_Trust_and_Safety_Policy.md`). Build requirements:

- **SOS/safety action** — visible only once a session is marked active (not before check-in, not after session ends). Options: End session (no penalty, no slide-to-confirm, must stay frictionless — this is a deliberate exception to the app's normal high-stakes-action pattern), Report a safety concern, Call emergency services (direct device call, not routed through Snapt).
- **Emergency contact / session sharing** — optional contact(s) stored in Profile, collected as an **email address** (not phone — Snapt does not use SMS); "Share my session" sends the meeting point, time window, and who they're meeting via email through **Resend**. Not a push/in-app notification — it goes to a non-Snapt-user email address.

- **Verified Creator badge** — surfaced on Creator Assignment cards and full Creator Profile, tied to completed background check status. No detail shown to clients beyond the badge itself.
 - **Admin escalation for SOS reports** — these must route to a high-priority Admin Portal queue with recommended real-time escalation (email via Resend to on-call staff), not just a dashboard entry. See Section 13 and Section 15.
 - **Content moderation queue** — policy exists (`@04_Content_and_Usage_Policy.md`) but the actual moderation system/tooling has not been designed. Flag to Don as a needed design session before Phase 4/5 build — currently only exists as a backend requirements bullet, no UI or workflow spec exists yet.
-

12. Occasion ↔ creator specialty matching

- CreatorProfile gets a `specialties` field (multi-select, same category set as client-facing Occasion: Events, Portraits, Social, Family, Wedding), required (≥ 1) at application, editable later.
 - Creator Assignment matching query must filter out (exclude, not deprioritize) creators lacking the relevant specialty for a given booking's Occasion.
 - "Why best match" reasoning shown to clients should surface specialty match as a stated reason where relevant, not just distance/availability.
-

13. Notification system

Full trigger-by-trigger reference: `@11_Notification_Trigger_Mapping.md` — this is the source of truth, build the dispatcher against it directly rather than re-deriving channel logic per feature.

Key architectural requirements:

- **Central notification dispatcher service** — listens for backend state-change events and fires the correct combination of push (FCM) / in-app / email (Resend), rather than notification logic scattered per-feature. No SMS channel exists in this product.
- Push vs. in-app rules are defined per-trigger in the mapping doc (~30 trigger types across booking, session, delivery, money, application status, and disputes)
- **Internal/admin alerts are a separate channel** — safety reports, general problem reports, moderation flags, strike escalations, and background check flags never reach end users as push/in-app; they route to the Admin Portal, with SOS-level reports needing real-time on-call escalation, not just a queue entry
- **Notification preferences** (client-facing, Profile → Notification settings) — kept intentionally minimal per Don's direction: Order updates, Messages, Booking reminders, Promotions & offers, plus a non-toggleable "critical account and security alerts" bucket that must include financial (payment/refund/payout) and safety/dispute notifications, not just narrow security/login alerts
- **Notification inbox categorization** — tabs: All, Bookings (renamed from Orders, now covers both order/editing status and booking status), Messages, Promotions.

Safety/account-critical items get distinct visual treatment (accent indicator) even without their own tab.

- **Permission priming** — a dedicated screen shown once after signup/application, before the native OS push permission dialog fires. Respect "Not now" — don't re-prompt in-app; user can re-enable from Notification settings later.
-

14. Legal & policy content management system

11 policy documents (Section 18) plus existing Terms of Service and Privacy Policy need to live in the app as **admin-editable, versioned content**, not static screens. Build requirements:

- **Draft vs. published state** — edits in the Admin Portal must not go live until explicitly published. This is required workflow, not optional: Don has stated these drafts need lawyer review before any version reaches real users.
 - **Version history + "Last updated" timestamps** — shown to users on each policy screen; needed both for transparency and for resolving disputes referencing what a policy said on a given date.
 - **Forced re-consent on material changes** — specifically for the **Creator Agreement** and **Background Check & Vetting Disclosure**, since these involve active consent, not passive disclosure. A material change should prompt existing creators to re-accept, not silently update under them.
 - **Placement beyond the Legal list** — Creator Agreement needs an explicit acceptance step in the Creator Application flow (separate from, alongside, the background check consent step). Background check consent step must link directly to the Background Check & Vetting Disclosure document.
 - Currently, CD has these as static placeholder screens with bracketed unresolved text preserved intentionally (e.g., "[Insert date]") — do not treat placeholder CD content as final copy to ship; real (lawyer-reviewed) text replaces it before production.
-

15. Admin Portal (not yet started — full scope)

This does not exist yet in any form and needs its own design pass before/alongside Phase 5 build. Confirmed scope as of this handoff:

- Manual booking/dispatch assignment
- Creator application review and vetting workflow
- Fee/promo rate settings (standard + promo, per Section 5/6 values, admin-editable)
- Dispute handling (Section 10) — review queue, evidence viewing, decision recording, appeal handling
- Review/content moderation (Section 11's flagged content, plus ratings/review moderation)
- Analytics
- **Creator strike history + override/reset** (Section 9)

- **Safety/SOS escalation queue** (Section 11) — needs real-time or near-real-time alerting, not just a passive dashboard
- **Legal & Policy Management** (Section 14) — draft/publish workflow, versioning, re-consent triggers

Build this against the same backend/data model established in Phases 0-1 — do not let it become an independently-designed system with its own assumptions about what a "booking" or "dispute" is.

16. Known bugs / carryover issues — verify current status before building on top of these screens

- **Device-frame rendering bug** (4 screens in restructured booking flow rendering outside the phone frame) — reported fixed by Don, not independently re-verified in this session.
- **Meeting Point screen: header/search field overlapping status bar on scroll** — status unknown, not confirmed fixed or re-flagged since originally reported.
- **Meeting Point screen: Continue button requires scroll to reach, not pinned to bottom** — same, status unknown.
- **Creator avatars disappearing across screens** — recurring issue across multiple "fix everywhere" passes historically; a final dedicated sweep was recommended but not confirmed done, especially across screens newly built this session.
- **"Brand Event" category reappearing after exclusion** — happened 3 times previously; needs re-confirmation especially on the newly rebuilt FAB sheet and new Creator Specialties field.

A CD Verification Checklist document exists covering all screens touched in the most recent design session — use it as the punch list for what's been checked vs. not.

17. Explicitly out of scope for MVP

Snapt Business / recurring bookings · Creator-set or negotiable rates · True on-demand (same-day) booking · Separate business account types · Real referral/credit program logic (Wallet's "Snapt Credit" remains a visual placeholder only)

18. Reference documents (attach alongside this handoff)

1. [Snapt_Project_Summary_v2.md](#) — base product/design summary
2. [01_Cancellation_and_Refund_Policy.md](#)
3. [02_Creator_Agreement.md](#)
4. [03_Trust_and_Safety_Policy.md](#)
5. [04_Content_and_Usage_Policy.md](#)
6. [05_Payment_and_Payout_Policy.md](#)
7. [06_Data_Retention_Policy.md](#)

8. `07_Minor_Safety_and_Age_Policy.md`
9. `08_Dispute_Resolution_Policy.md`
10. `09_Background_Check_and_Vetting_Disclosure.md`
11. `10_Accessibility_Statement.md`
12. `11_Notification_Trigger_Mapping.md`
13. `CD_Verification_Checklist.md`

All policy documents are **working drafts pending attorney review** — the legal *logic and numbers* in this handoff (fee tiers, windows, strike thresholds) are the same numbers baked into those documents and can be built against, but the *legal language itself* will change after review. Build the system to make that language editable (Section 14), not the business logic — the numbers are the product decision; the wording is the legal layer on top of it.

19. Immediate next steps for Claude Code

1. Set up Phase 0 foundation (Section 2-3) and the core data model (Section 4).
2. Before building Phase 2 payment/dispute logic, get Don's confirmation on the open values in Section 6 — particularly the dispute-window/payout-window conflict, since it affects the payout engine's design directly.
3. Build in the phase order in Section 3. Flag to Don if the remote-editing-first MVP sequencing question (end of Section 3) needs resolving before sprint planning.
4. Treat CD prototype screens as directional reference per Section 0 — confirm ambiguous UI/flow details with Don rather than assuming, especially anywhere this document and the prototype might not perfectly agree.
5. Do not ship any of the 12 policy documents' current text to production — placeholder/draft text only, pending attorney review, per Section 14.
