

Snapt — Project Summary (Updated)

What Snap Is

An on-demand app connecting clients with vetted content creators, either booked to capture photos/video in person, or hired remotely to edit content the client already has. Launching in Saint Lucia first (not referenced by name in-app), expanding across the wider Caribbean after.

App Name & Brand

- **Name:** Snap
- **Colors:** Primary yellow/gold (■ #FFB800), off-white background (□ #FAFAFA), near-black (■ #1A1A1A) (also used for FAB and secondary UI), muted grey (■ #767676), success green (■ #2ECC71), error red (■ #EB5757)
- **Typography:** Inter (Bold/Semibold/Regular)
- **Tone:** warm, easygoing, confident, never corporate
- **Style:** rounded 16px cards, soft shadows, floating black-pill bottom nav (transparent background, content visible behind it, active tab highlighted in primary yellow — applied app-wide)

App Structure

One app, Client/Creator mode toggle in Profile. Everyone signs up as a client by default. "Become a Creator" in Profile leads to application/vetting. Gating logic (not applied → application; under review → status screen; approved → real switch) is **currently simulated client-side only** — real build needs server-side authorization. Mode persists across relaunch. Separate Available/Unavailable toggle inside Creator mode controls job-matching visibility.

Onboarding (New)

3-screen onboarding sequence shown **before** signup, built from AI-generated reference images (Black subjects throughout, per explicit requirement):

1. "Tell us what you need" — Book a creator / Upload footage
2. "We match or edit" — matched creator or sent to editing (creator avatar reuses existing established creator photos, e.g. Jordan, for consistency)
3. "Get it delivered" — final content ready, "Get Started" leads to Sign Up

Skip available on screens 1-2, not on screen 3. Pagination dots throughout.

Registration/Login flow (email/phone + Google/Apple/Facebook OAuth, verification code for email/phone only, currency selection) sits after onboarding, before landing on Client Home.

Booking Flow — Recently Restructured (Major Change)

The original flow (Occasion → Date/Time → Duration → Location → Creator Assignment) was identified as structurally flawed and **re-sequenced**:

Root issues identified:

1. "Area" (matching input) and "exact meeting point" (fulfillment detail) were conflated into one location step — now split into two separate steps at two different points in the flow.
2. The quick-start form didn't branch for Remote vs In-person, showing irrelevant fields (date/location) for remote edits.
3. Availability was discovered too late (after 4+ screens of input), risking dead-end "no creators available" states after heavy user investment.

New flow order:

1. **Quick-start form (Home + FAB)** — branches on "In person or Remote?" first. Remote → collapses to just Upload footage. In-person → Occasion + **Area dropdown** (flat list of 20 named areas, no map at this step) → "Check availability"
2. **Duration & Package** (existing screen, unchanged)
3. **Date & Time** — now **availability-aware**: calendar shows availability dots, time slots only show real bookable options (simulated in prototype via demo toggle; real build needs a genuine slot-availability engine — flagged for backend doc)
4. **Creator Assignment** (existing screen — now only shows genuinely available creators; enhanced with avatars, distance, "why best match" reasoning, View Profile links)
5. **Exact Meeting Point** (repurposed "Where's the Session?" map screen) — moved to *after* creator selection, reframed as "Where exactly should [Creator] meet you?", includes area-snapping label ("You've selected: Rodney Bay area"), draggable pin, existing outside-service-area error state, plus new optional directions field ("e.g. blue gate, beach entrance") that carries through to the creator's Job Detail screen
6. **Order Summary** — location line now shows both area + pinned point (e.g. "Rodney Bay — pinned meeting point"), with Edit links back to relevant steps
7. **Payment → Session Day** (unchanged)

Old skip-logic (skipping the map screen entirely if Home had a location) was removed — area selection and exact meeting point are now two distinct, always-captured steps.

Location / Service Area Logic

- **20 named service areas** (north Saint Lucia): Cap Estate, Cas en Bas, Gros Islet, Rodney Bay, Monchy, Mongiraud, Choc, Vigie, La Clery, Castries, Ciceron, Good Lands, Balata, Cabiche, Girard Cocoa, Babonneau, Garrand, Boguis, Marquis, Cape Marquis
- A prior attempt to **restrict all location search app-wide to only these 20 names** (blocking free-form search entirely) was implemented then **rolled back**

- Current approach: flat dropdown of the 20 areas for the early "Area" quick-start field; the later "Exact Meeting Point" map screen keeps full free-form map/pin interaction with **automatic snap-to-nearest-named-area labeling**, validated against the existing outer service-area polygon (existing "outside service area" error state retained)

Floating Action Button (FAB) — New

- Persistent circular FAB, near-black (● #1A1A1A), bottom-right, above the nav bar
- Visible on Home, Bookings, Wallet, Profile — **never on screens that already use the floating chat button** (Order Tracker, Session Day) — mutually exclusive by screen
- Tap: icon morphs to X, bottom sheet slides up with the same branching quick-start booking form
- Fixed: a z-index/layering bug where nested pickers (date, location) rendered behind the FAB sheet, blocking interaction — corrected so pickers render on top

Client App — Status

Fully built and heavily refined across many rounds: Home (hero, branching quick-start form, swipeable category chips w/ custom emojis, Featured Creators vertical list, "How it works" covering both paths), Snap Edit upload flow, restructured Book-a-Creator flow (see above), Bookings, Wallet, Profile (Client/Creator toggle, Ratings & Growth w/ trend + category breakdown, Account section, Legal section, Edit Profile, Delete Account), Help & Support (FAQ, Contact Support, Report a Problem), Notifications inbox.

Known unresolved bug (most recent): several screens in the restructured flow (Creator Assignment, Order Summary, Payment sheet, Session Day) are rendering **outside the phone device frame** in the prototype — a containment/layout regression, fix was just requested, not yet confirmed resolved. Also: header/search field overlapping the status bar on scroll on the Meeting Point screen, and the Continue button on that same screen needs to be pinned to the bottom rather than requiring scroll to reach.

Creator App — Status

Fully built: Application & Vetting (branches for Remote/In-Person/Both, background check only for in-person), Job Feed, Schedule (working hours, blocked dates, service radius for in-person only), full in-person session flow (on-the-way → check-in w/ safety code → session active → submit footage [distinct from client upload, amber "submitted" icon] → Editing Workspace → upload finished edit → green "Edit Submitted" = true completion, triggers client's tracker to "Ready"), Earnings (Pending/Available/Paid Out, 32% platform fee w/ promo-rate strikethrough support, 48-72h holding window), two-way Ratings & Growth.

Key Business Decisions

- Standardized pricing — no creator-set or negotiable rates, anywhere (recurring regression to watch for)
- Client service fee: **8%**, shown as line item at checkout
- Creator platform fee: **32%** (raised from 18% due to Caribbean Stripe processing costs, ~5% + \$2/transaction)

- Both fees need to be admin-configurable later (standard + optional promo rate)
- No true on-demand booking at MVP — scheduled only, 14-day advance window
- One free revision included per order; additional rounds are paid add-ons
- Currency: USD default, XCD optional, fixed peg 2.70 XCD = 1 USD, stored in base currency (USD), converted for display only
- Raw footage never visible to clients — creator/editor access only
- Client upload flow and creator footage-submission flow are structurally separate, must never cross-route
- Slide-to-confirm reserved for: Pay, End Session & Upload, Submit Footage, Submit Finished Edit, Delete Account, Cancel/Decline — not applied to routine nav buttons
- "Snapt Business" / recurring bookings concept was tried once and **rolled back** — not in scope
- Referral/credit system ("Snapt Credit" on Wallet) is a **visual placeholder only**, no real logic built

Tech Stack Decided

- **Frontend:** React Native + Expo
- **Backend:** Node.js/TypeScript
- **Database:** PostgreSQL via **Supabase** (also Auth)
- **File storage:** **Cloudflare R2**
- **Payments:** **Stripe** + likely **Stripe Connect** for payout splitting
- **Push notifications:** Firebase Cloud Messaging
- **Maps:** Google Maps API (prototype still shows unconfigured dev-mode watermark — real production key/billing/domain setup needed)
- **Auth:** Email/phone + Google/Apple/Facebook OAuth
- **Admin Portal:** separate responsive web app — **not yet started**

Backend Requirements Doc (running list, not yet finalized)

Server-side creator approval/authorization (never client-trusted) · Admin-driven vetting workflow + background check vendor (non-US document support) · Stripe Connect payment splitting · Configurable fee tables (standard + promo, admin-editable) · Pending/Available/Paid-out earnings logic w/ holding window · Currency conversion (fixed peg, base-currency storage) · Server-side enforcement of upload limits and service-area validation · Cloudflare R2 integration · Google Maps production setup · Strict data permission separation (raw files creator-only) · 14-day booking window enforcement · SMS/email verification provider (not chosen — Twilio likely) · Real-time chat infra (Supabase Realtime likely fit) · Live GPS tracking for "creator en route" · Content moderation queue for creator uploads (not designed) · Real legal content (T&C/Privacy Policy currently filler) · Data retention policy for ID/background check docs · Notification triggers list · Rating category schema (both directions) + trend calculation · Reviewer-history visibility access control · **NEW: Slot-availability engine** — computes real bookable date/time slots from creator schedules, service areas, and existing bookings; this is the

backend logic behind the newly availability-aware Date & Time screen, and doubles as the foundation for admin's manual dispatch tooling · **NEW: Area-snapping/geocoding logic** — nearest-named-area resolution from arbitrary map coordinates, validated against the service-area polygon

Explicitly Out of Scope for MVP

Snap Business / recurring bookings · Creator-set or negotiable rates · True on-demand (same-day) booking · Separate business account types · Real referral/credit program logic

Known Recurring Issues to Watch For

- **Creator avatars/photos going missing** — recurred across multiple screens despite several "fix everywhere" passes; last confirmed present on Home, Featured Creators, and the rebuilt Creator Assignment screen — worth a final dedicated sweep
- **"Brand Event" category** reappearing after explicit exclusion — happened 3 times previously; not present in the latest restructured flow
- Placeholder/raw prompt text leaking into live creator cards — fixed reactively each time
- **NEW: Screens rendering outside the device frame** — just flagged on 4 screens in the restructured booking flow, fix requested, not yet confirmed
- Google Maps "can't load correctly" watermark appears throughout prototype screens with maps — this is expected in the prototype (unconfigured dev API key), not a Claude Design bug, ignore until real backend setup

Current Status

- **Client app:** fully built, both flows, just underwent a major booking-flow restructure (re-sequencing + meeting-point split + availability-awareness) — restructure fix just sent, rendering bug (screens outside device frame) needs re-verification before considering this closed
- **Creator app:** fully built, application through earnings and ratings
- **Onboarding:** newly built (3 screens), needs a click-through test
- **FAB:** newly built, needs testing across all applicable screens (Home, Bookings, Wallet, Profile) and confirmation it's absent from chat-enabled screens
- **Not started:** Admin Portal (web-based, separate scoping session needed), finalized backend requirements doc (running list needs compiling into a clean handoff document), real legal content, actual FAQ copy

Immediate Next Steps

1. Re-verify the device-frame rendering fix and the Meeting Point screen layout fixes just requested
2. Run a full end-to-end click-through of the **restructured** booking flow specifically (this changed significantly and hasn't been fully re-tested since)
3. Test onboarding sequence and FAB across all applicable screens

4. Finish the broader QA pass using the dedicated testing guide (separate artifact from earlier in this project) — note the guide reflects the *pre-restructure* flow order and will need minor updates to match the new sequence
5. Scope and design the Admin Portal (web layout — manual booking/dispatch assignment, creator application review, fee/promo settings, dispute handling, review moderation, analytics)
6. Compile the full backend requirements doc into a clean handoff document for Claude Code, with special attention to the new slot-availability engine and area-snapping logic, since these are more complex than most other items on the list
7. Draft real Terms & Conditions, Privacy Policy, and FAQ content
8. Set up real infrastructure accounts: Supabase, Cloudflare R2, Stripe (+Connect), Google Maps API (production), Firebase, OAuth credentials, SMS/email provider
